

Sarathi

Product Plan and High-Level Flow

Trust assistant for confident checkout decisions

1. Product Goal

Sarathi helps a buyer decide:

Can I trust this product, this seller, this size, this offer, and this payment choice before checkout?

The goal is to reduce wrong purchases, avoidable returns, and COD rejection by giving buyers a simple evidence-backed decision before they place an order.

2. Problem

- ? many sellers list similar-looking products
- ? the cheapest option may not be safest
- ? seller rating and product rating can conflict
- ? size, fabric, color, and quality are hard to judge online
- ? reviews may be generic or misleading
- ? offer timers and prepaid offers can create pressure
- ? COD rejection causes delivery, return, inventory, support, and seller cost

3. Users And Product Surfaces

User / Surface	Need
Buyer App	Simple recommendation, size help, offer truth, payment confidence, and privacy control.
Seller Portal	Fair discovery, clear improvement tasks, and aggregate buyer feedback without private buyer data.
Admin Review Console	Seller verification, listing approval, proof review, and auditability.

All surfaces share one trust evidence layer: product and SKU facts, seller verification, seller/product ratings, review credibility, return reasons, offer history, payment offers, buyer fit memory, proof assets, outcomes, and audit traces.

4. Core Buyer Experience

- ? buyer searches, opens, or wishlists product
- ? Sarathi checks similar seller listings
- ? trust score is calculated for product-SKU-seller
- ? buyer sees recommendation, reason, size guidance, warning
- ? buyer can ask Sarathi a product question
- ? missing proof creates aggregate seller proof request
- ? checkout checks offer truth and prepaid confidence
- ? delivery outcome updates future trust

5. Core Features

Feature	What it does
Trust Score	Shows 72/100-style score with confidence, reasons, risks, and missing evidence.
Similar Listing Resolver	Compares similar listings and recommends one safer option plus one alternative.
New Seller Fair-Start	Gives verified new sellers fair exposure without fake buyer trust.
Per-SKU Trust Passport	Shows exact variant trust, proof, return reasons, and missing evidence.
Size Oracle	Recommends safer size using buyer memory and SKU/category outcomes.
Galti Mat Dohrao	Shows one avoidable warning such as color mismatch or size risk.
Sarathi Samvaad	Lets buyer ask fit, fabric, seller trust, offer, or checkout questions.
Knowledge Graph	Connects seller, product, SKU, reviews, returns, proof, offer, checkout, and outcomes.
Review Credibility	Downweights generic, repeated, stale, or contradicted reviews.
Checkout Confidence	Nudges prepaid only when trust is strong enough.
Seller Evidence Coach	Turns buyer doubts into aggregate seller proof/improvement tasks.
Admin Review	Controls verification, listing approval, proof validation, and audit trail.

6. Trust Score Approach

Signal	Why it matters
SKU kept-order outcome	Real kept/returned behavior is the strongest signal.
Seller reliability and verification	Affects fulfillment, support, and trust.
Fit and size consistency	Reduces avoidable size-related returns.
Review credibility	Prevents false-positive reviews from misleading the score.
Proof coverage	Reduces fabric, color, and packaging doubts.
Offer truth and dispatch	Important near checkout, but should not override product trust.
Price value	Price matters, but cheapest should not automatically win.

7. New Seller Fair-Start, Graph, And Review Logic

- ? new verified sellers use category prior and fair-start exposure
- ? buyer-facing confidence remains provisional until enough outcomes exist
- ? unverified or restricted sellers do not receive fair-start benefit
- ? graph connects Buyer -> Fit Memory -> SKU -> Product -> Seller -> Reviews -> Returns -> Proof -> Offer -> Checkout -> Outcome
- ? low seller rating + high product rating means product may be good but seller risk remains
- ? high seller rating + low product rating means seller may be reliable but SKU is risky
- ? positive reviews + high returns means reviews may be false positives and contradicted attributes are downweighted

8. Checkout Confidence

Mode	When	Buyer copy
Prepaid Recommended	Trust is strong and saving is verified.	Pay online to save Rs 40. Sarthi checked seller trust, product evidence, and offer truth. COD is still available.
Balanced Choice	Trust is moderate or proof is missing.	Prepaid can save Rs 25, but fabric proof is still limited. Choose prepaid only if you are comfortable.
No Prepaid Nudge	Trust is weak or data is unclear.	Sarthi is not recommending prepaid for this item yet because evidence is limited.

Hard blockers: seller restricted, seller verification pending, offer not verified, weak product evidence, unclear refund/payment information, stale data, or high return risk.

9. Data And Architecture

Component	Purpose
MongoDB Atlas	Stores product evidence, scores, traces, checkout sessions, proof requests, and cache.
Atlas Search	Searches products, reviews, seller proof, and text evidence.
Atlas Vector Search	Finds similar reviews, doubts, questions, and proof evidence.
Neo4j	Stores weighted relationships for graph reasoning.
Object Storage	Stores proof images, seller documents, and listing media.

Entire Closed-Loop System

Buyer Flow

Seller And Admin Flow

10. Implementation Phases

- ? Trust Score: weighted score, breakdown, confidence, and new seller fair-start
- ? Knowledge Graph: seller, product, SKU, reviews, returns, proof, offer, checkout, and outcome relationships
- ? Checkout Confidence: prepaid confidence score and safe nudges

- ? Seller Evidence Loop: buyer doubts and return reasons become aggregate seller tasks
- ? MongoDB Atlas Integration: evidence, snapshots, traces, sessions, and cache
- ? End-to-End Demo: connected buyer, checkout, seller, admin, and outcome learning flow

11. Success Metrics

- ? kept-order rate
- ? avoidable return reduction
- ? COD rejection reduction
- ? prepaid adoption under high-trust conditions

- ? seller proof task completion
- ? recommendation abstention when evidence is weak
- ? cache hit rate for repeated agent queries
- ? buyer memory opt-out correctness

12. Final Summary

Sarathi is a closed-loop trust product. It starts with buyer confusion, calculates explainable trust, supports safer checkout decisions, sends aggregate proof gaps to sellers, uses admin review for governance, and learns from delivery outcomes.
